

```
Microsoft HotelBooking System 11/30/2015 10:12:07 AM HotelBooking System . Wed Mar 21 16:53:49 2016 ~ A: I would suggest the following, where data is stored in a json string. import pandas as pd import requests from bs4 import BeautifulSoup def main(content): soup = BeautifulSoup(content, "html.parser") data = { "name": [], "pic": [], "email": [], "email": [], "password": [], "manager": [], "comments": [], "created_date": [], "room_conf": [], "rooms": [] } for i in soup.findAll({"class": "msgBody"}): # remove "smart" tag content = i.find_all(".smart")[0].text content = content.strip() # split content for room_conf content = content.split("Â°") # save content to json data["name"].append(content[0]) data["pic"].append(content[1]) data["email"].append(content[2]) data["password"].append(content[3]) data["manager"].append(content[4]) data["comments"].append(content[5]) data["created_date"].append
```
